1 Overview

This document provides instruction on how to prepare a Linux system for use with NerveCenter 6.2.00, how to install NerveCenter on the Linux host and how to manage NerveCenter together with the Linux host following the installation.

This document is only a guide and is not intended to be a definitive set of instructions for all sites to follow. Your site requirements will dictate deviations. In general, these same steps may be followed to prepare most Linux systems for use with NerveCenter 6.2.00.

1.1 Terminology

NerveCenter is commonly deployed through two types of installations: NerveCenter Servers and NerveCenter Clients.

- **The NerveCenter Server** is the software package that is installed on a Linux or Solaris system and runs as a service on that platform.

- **The NerveCenter Client** is the software package that is installed on Linux or Microsoft Windows desktops and is used to access NerveCenter Servers running in your environment.

When NerveCenter Server is installed on a Linux or Solaris host, the result is the addition of NerveCenter as a runnable service much like other network services (ex: DNS, DHCP, LDAP Directory Servers, etc.). Thus the installed NerveCenter Server software package is referred to as the NerveCenter Service.

A running NerveCenter Service consists of a collection of processes, each providing function-specific duties as part of NervCenter’s overall network management operation. Core to this is the NerveCenter Server process, better referred to as ncserver so as to distinguish it apart from references to the overall NerveCenter Server software package. Other key processes of the NerveCenter Service are its SNMP Pollers, each referred to as an ncsnmppoller, associated SNMP Stacks and various notification listeners.

The NerveCenter Client software package, which can be installed on Windows and Linux desktops, provides the means for monitoring and configuring NerveCenter Servers. It consists of an Administrator application, used for configuration review and editing, and a Client application, used for monitoring, creating and editing NerveCenter’s alarm models, polls and trap masks.

This document focuses on installation and configuration of the NerveCenter Server software package. A separate document covers installation and usage of the NerveCenter Client package; see [http://docs.logmatrix.com/NerveCenter/6.2.00/](http://docs.logmatrix.com/NerveCenter/6.2.00/).
1.2 Applicable Linux Distributions

LogMatrix developed and tested NerveCenter 6.2.00 for use on a set of commercial Linux distributions. LogMatrix strongly recommends selecting a Linux distribution from this set.

<table>
<thead>
<tr>
<th>Supported Linux Distributions</th>
</tr>
</thead>
<tbody>
<tr>
<td>RedHat Enterprise Linux 6 (RHEL6) for x86_64</td>
</tr>
<tr>
<td>Community Enterprise Operating System 6 (CentOS6) for x86_64</td>
</tr>
<tr>
<td>Oracle Linux 6 for x86_64</td>
</tr>
<tr>
<td>SUSE Linux Enterprise Server 11 SP3 (SLES11) for x86_64</td>
</tr>
</tbody>
</table>

If your site has a need for a Linux distribution outside of this set, contact LogMatrix for assistance.

**Note:** NerveCenter 6.2.00 is incompatible with RedHat Enterprise Linux 5 (RHEL5) or earlier and thus also Community Enterprise Operating System 5 (CentOS5) and earlier plus Oracle Linux 5 and earlier. Use the prior release, NerveCenter 6.1.00, if your site is running RHEL5, CentOS5 or Oracle Linux 5; contact LogMatrix for assistance.

LogMatrix highly recommends obtaining support access for whichever Linux distribution you select and keeping your host system(s) updated with the latest patches.

2 Linux Host Preparation

2.1 Linux Installation

2.2 Network Configuration

While not required, LogMatrix recommends as a best practice that the Linux host’s network connections are configured to use static IPv4, and optionally IPv6, addresses. If DHCP is required for your environment, LogMatrix recommends that the DHCP Service is configured to provide a permanent reservation for the Linux host system.

At least one network connection on the Linux host needs to be setup for IPv4 addressing. This is required for allowing access from the NerveCenter Administrator and Client applications.

**Note:** This IPv4 requirement will be removed in NerveCenter 7.
2.3 Groups and Users Accounts

NerveCenter 6.2 requires two entries, ‘ncadms’ and ‘ncusers’, be defined in the Linux host’s group database (typically the file /etc/group). These groups are required to exist at the point of installation and will be used thereafter by NerveCenter during its operation.

Create the ‘ncadms’ and ‘ncuser’s groups through the toolset provided with the Linux distribution. Ex: YaST on SLES, or system-config-users on RHEL6 and Oracle Linux 6.

NerveCenter Server runs in the context of a designated user account. This account must be a member of the ‘ncadms’ group. There is no required name for this account.

Note: NerveCenter installation can occur before the ‘ncadms’ group is populated. However in order for the NerveCenter installation to be completed, one or more user accounts need to be added to the ‘ncadms’ group. Instruction in section 4.1.1 User Account Selection revisits this step.

2.4 Host Software Package Provisioning

NerveCenter 6.2 consists of a number of both 32- and 64-bit applications. As a result a set of 32-bit software packages need to be present in addition to their 64-bit equivalents.

2.4.1 RHEL6, CentOS6, and Oracle Linux 6

Ensure the following 32-bit packages and their dependencies are installed before installing NerveCenter. The typical method for package management is through the user of ‘yum’. To access the 32-bit version of these required packages, you need to use the command form “yum install PKG.i686”, where PKG is replaced by the package name.

Note: ‘yum’ may balk at installing packages if their respective 64-bit version is out of date. If this occurs, first update the 64-bit version of the named package and then retry the installation of the 32-bit version. For example “yum update db4” might be required before “yum install db4.i686” can be successfully carried out.

Table 1 Required 32-bit Software Packages

<table>
<thead>
<tr>
<th>Package</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>glibc.i686</td>
<td># yum install glibc.i686</td>
</tr>
<tr>
<td>libgcc.i686</td>
<td># yum install libgcc.i686</td>
</tr>
<tr>
<td>libXt.i686</td>
<td># yum install libXt.i686</td>
</tr>
<tr>
<td>libXext.i686</td>
<td># yum install libXext.i686</td>
</tr>
<tr>
<td>libxml2.i686</td>
<td># yum install libxml2.i686</td>
</tr>
</tbody>
</table>
Additionally, the following 32-bit packages will be needed if your usage of NerveCenter evolves to include usage of the Perl modules listed in the right-hand column of Table 2. NerveCenter itself does not require these Perl modules so these packages are needed only if your usage of NerveCenter or its Perl5.14 environment comes to require them.

Table 2 Optional 32-bit Software Packages

<table>
<thead>
<tr>
<th>Package</th>
<th>Command</th>
<th>Used by Perl module(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Openssl</td>
<td># yum install openssl.i686</td>
<td>Net::SSLeay</td>
</tr>
<tr>
<td>Libcurl</td>
<td># yum install libcurl.i686</td>
<td>WWW::Curl</td>
</tr>
<tr>
<td>db4</td>
<td># yum install db4.i686</td>
<td>DB_File</td>
</tr>
<tr>
<td></td>
<td></td>
<td>NDBM_File</td>
</tr>
<tr>
<td>Gdbm</td>
<td># yum install gdbm.i686</td>
<td>GDBM_File</td>
</tr>
</tbody>
</table>

2.4.2 SLES11 SP3

No additional software is needed. The standard SLES SP3 installation includes the 32-bit packages needed to run NerveCenter.

2.5 Host Firewall Configuration

The NerveCenter Service – the NerveCenter Server and its related components – running on the Linux host are typically accessed over your network from client applications running on Windows or Linux desktops. The NerveCenter 6.2 Windows Desktop applications, for example, installed on a Microsoft Windows XP, Vista, 7, 8.1, or 10 desktop or a Microsoft Windows Server 2003 R2, 2008 R2 or 2012 R2 host are the typical means for accessing NerveCenter Servers running in your environment, whether they are running on Linux or Solaris. In order for this access to work, the firewall where the NerveCenter Server is running needs to be configured per the instructions below.

2.5.1 TCP/UDP Ports

In order for permit network access to the NerveCenter Service, the following ports need to be examined on the Linux host firewall. To review and change the firewall configuration use the management tool provided with your Linux distribution. Ex: YaST on SLES or system-config-firewall on RHEL6, CentOS6 and Oracle Linux 6.

Table 3 NerveCenter TCP Ports

<table>
<thead>
<tr>
<th>Port</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>32504/tcp</td>
<td>Allows the NerveCenter Service to receive connections from NerveCenter Administrator (ncadmin.exe) and NerveCenter Client (ncclient.exe)</td>
</tr>
</tbody>
</table>
applications running on Windows desktops.

This port assignment is configurable via the ‘Connections’ tab of the NerveCenter Administrator application. The NerveCenter Service retains this value in its configuration file at /opt/OSInc/conf/nervecenter.xml.

<table>
<thead>
<tr>
<th>Port</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>32505/tcp</td>
<td>Allows the NerveCenter Service to receive notifications sent by other NerveCenter Servers and for NerveCenter Servers to access each other’s Node Lists. Should your site have only one NerveCenter Server installation or not require NerveCenter-to-NerveCenter Informs or Node List acquisition, this port does not need to be open. This port assignment is configurable via the ‘Connections’ tab of the NerveCenter Administrator application. The NerveCenter Service retains this value in its configuration file at /opt/OSInc/conf/nervecenter.xml.</td>
</tr>
<tr>
<td>32506/tcp</td>
<td>Allows the NerveCenter Service to receive connections from NerveCenter Command (nccmd.exe), a command-line utility, running on Windows or Linux systems. Should your site not plan to use the NerveCenter Command utility from remote desktop hosts, this port does not need to be open. This port assignment is configurable via the ‘Connections’ tab of the NerveCenter Administrator application. The NerveCenter Service retains this value in its configuration file at /opt/OSInc/conf/nervecenter.xml.</td>
</tr>
<tr>
<td>32508/tcp</td>
<td>Allows the NerveCenter Service to receive connections to its API interface from scripts running on remote systems. Should your site not plan to use the NerveCenter API from remote systems or desktops, this port does not need to be open. This port assignment is configurable via the ‘Connections’ tab of the NerveCenter Administrator application. The NerveCenter Service retains this value in its configuration file at /opt/OSInc/conf/nervecenter.xml.</td>
</tr>
</tbody>
</table>

In order to receive SNMP Notifications or to allow NerveCenter to respond to SNMP queries, two UDP ports need to be enabled in the firewall.

**Table 4 NerveCenter UDP Ports**

<table>
<thead>
<tr>
<th>Port</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>161/udp</td>
<td>Allows the NerveCenter Services’ SNMP Management Interface to receive incoming SNMP requests (Get, GetNext, GetBulk) from other network systems.</td>
</tr>
</tbody>
</table>
management platforms.

Should you not have a need to poll the NerveCenter Service via SNMP, this port does not need to be open.

This port assignment is configurable via the ‘SNMP’ tab of the NerveCenter Administrator application. The NerveCenter Service retains this value in its configuration file at /opt/OSInc/conf/nervecenter.xml.

The NerveCenter SNMP Management Interface is not enabled by default. Setup is provided via the ‘SNMP Agent’ tab of the NerveCenter Administrator application.

Note: If you are running the SNMP service provided by your Linux distribution (most likely snmpd from net-snmp), this will also be using 161/udp by default. If you want to run both the NerveCenter SNMP Management Interface and the net-snmp service, one or the other needs to be set to use a different port. Refer to the documentation at http://net-snmp.org/ on how to configure net-snmp.

<table>
<thead>
<tr>
<th>162/udp</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allows NerveCenter Server to receive incoming SNMP notification messages (Trap, Inform) sent from SNMP Agents and other SNMP Management Applications.</td>
</tr>
<tr>
<td>Should you not need to receive SNMP notifications, this port does not need to be open.</td>
</tr>
<tr>
<td>This port assignment is configurable via the ‘SNMP’ tab of the NerveCenter Administrator application. The NerveCenter Service retains this value in its configuration file at /opt/OSInc/conf/nervecenter.xml.</td>
</tr>
<tr>
<td>Note: If you are running the SNMP Trap Receiver provided by your Linux distribution (most likely snmptrapd from net-snmp), this will also be using 161/udp by default. If you want to run both allow NerveCenter to receive SNMP notifications and run the net-snmp snmptrapd service, one or the other needs to set to use a different port. Refer to the documentation at <a href="http://net-snmp.org/">http://net-snmp.org/</a> on how to configure net-snmp.</td>
</tr>
</tbody>
</table>

### 2.5.2 ICMP Filtering

Review the firewall configuration’s filtering of incoming ICMP traffic.

NerveCenter relies on ICMP and ICMPv6 messages for Echo Request and Echo Reply (the ‘ping’ command) as well as being able to receive Destination Unreachable notifications. These three ICMP message types need to be permitted through the firewall.
Additionally, NerveCenter can be used to monitor all incoming ICMP, but only to the extent permitted by the firewall ICMP Filtering rules.

2.6 Linux Services Configuration

2.6.1 SNMP Services

If your host is running the SNMP services provided with your Linux distribution (likely net-snmp), they and the NerveCenter installation might conflict. Review the host service configuration and the service configuration of the net-snmp Master Agent (snmpd) and Trap Receiver (snmptrapd) to find whether these services are enabled and which ports they are accessing.

The net-snmp Master Agent and Trap Receiver will open 161/udp and 162/udp respectively by default.

If the NerveCenter Service is to be receiving incoming SNMP notification traffic, either NerveCenter or net-snmp must be configured to use a port other than 162/udp.

If the NerveCenter SNMP Management Interface is to be enabled, either NerveCenter or the net-snmp service must be configured to use a port other than 161/udp.

2.6.2 RPC Services

NerveCenter 6.2 requires a running and accessible RPC service.

Using the services configuration tool for your Linux host (system-config-services on RHEL6 and Oracle Linux 6, YaST on SLES11), verify that rpcbind is enabled and running.

**Note:** This dependency is being removed; NerveCenter 7 will not require RPC.

**SLES11:** If NerveCenter is to be run using an account other than the super-user account, RPC needs to be configured to allow this. Because of access controls, the rpcbind service needs to be configured to run in ‘insecure mode’. To do this, edit /etc/sysconfig/rpcbind to contain the following:

```
RPCBIND_OPTIONS="-i"
```

Then restart the RPC service, from the super-user account, using

```
# /etc/init.d/rpcbind restart
```

3 NerveCenter Installation

NerveCenter installs to /opt/OSInc . The NerveCenter installation process will also add /var/opt/NerveCenter . It will also create the file /etc/pam.d/nervecenter if none exists. Likewise, it will create file /etc/ld.conf.so.d/nervecenter.conf if none exists.
Complete the following steps in order to install NerveCenter 6.2 on the Linux host.

1. Receive and expand the installation kit.

   ```
   # zcat NC6200-Linux-BLDnn.tar.gz
   
   Note: Replace the ‘nn’ with a number (ex: ‘15’) so as to match the name of the received file.
   
   # tar -xf NC6200-Linux.tar
   
   This creates a folder NC6200/ in the file system beneath where the command is executed.
   
   2. Install the NerveCenter product.
   
   ```
   
   # cd NC6200/BIN
   # ./install
   
   The installer will check that the groups ‘ncadmins’ and ‘ncusers’ are defined for this system. If they are not, it will complain and exit. If this occurs, add the missing group(s) and then restart the installation with “./install”

   During the installation, request the following components: a c m s

   - a – Administrator
   - c – Client
   - m – MIB Compiler
   - s – Server

4  NerveCenter Post-Installation

Following the installation, several setup steps need to be taken. Once these are performed, the service is ready for usage.

4.1  Permissions

4.1.1  User Account Selection

The NerveCenter Service is associated with a user account at runtime. Operations that NerveCenter performs are granted and limited based on the privileges granted to the selected account.

To setup the runtime account association, perform the following steps:

   1. Select or create an account that will be used as the NerveCenter runtime account.
2. Add the selected account to the ‘ncadmins’ group in Linux group database (typically /etc/group).

   **Note**: The ‘ncadmins’ group needs to always contain this selected account but may contain additional accounts. All accounts that are a member of ‘ncadmins’ are granted NerveCenter Administrator access when logging in to the NerveCenter Service through the NerveCenter Client, Administrator or Command applications.

   This file is used as a protection over which accounts are allowed to run the NerveCenter Service. If the file is present, then only accounts listed in the file may start the NerveCenter Service. If the file is not present, then any member of the ‘ncadmins’ group may start the NerveCenter Service.

   Create or edit /opt/OSInc/conf/ncstart-authorized so that it contains each permitted account name between colons on separate lines.

   Ex: if the permitted accounts are ‘nervecenter’ and ‘admin’, then the file should contain two lines

   [01] :nervecenter:
   [02] :admin:

4. Optionally, setup the NerveCenter Startup User File (ncstart-user).

   This file is used to identify the account to be used when NerveCenter is started at system boot or is started from a command prompt. If this file is present, its content names the account that is to be used. If this file is not present, then NerveCenter will run as the super-user account.

   Create or edit the file /opt/OSInc/conf/ncstart-user so that it contains the name of this account as its sole content on the first line. If NerveCenter is setup to be started at system boot time, this file is accessed to determine the account that is to be used for NerveCenter’s operation.

   Ex: if NerveCenter is to run as account ‘nervecenter’, then the file should contain ‘nervecenter’ as its sole content.

   [01] nervecenter

   **Note**: Unlike the ncstart-authorized file, the name in ncstart-user is not delimited with :'s.

   **Note**: Unlike the ncstart-authorized file, there can only be one entry in ncstart-user.
NerveCenter 6.2 Release Notes

Note: If you setup NerveCenter with both a ncstart-authorized and a ncstart-user file, ensure that the two files agree. The account named in ncstart-user must also be named in ncstart-authorized.

4.1.2 File Permission Setup

To ensure permissions are correct, run the script /opt/OSInc/nc/bin/ncpermissions. This script sets the owner, group, and access values for NerveCenter’s directories and files under /opt/OSInc and /var/opt/NerveCenter.

```bash
# /opt/OSInc/nc/bin/ncpermissions
```

Note: ncpermissions is meant for execution by the super-user account. Other accounts will not have privileges needed to set directory and file ownerships and permissions.

The command /opt/OSInc/nc/bin/nccheckdirs can be subsequently used to verify some of these directory settings.

```bash
# /opt/OSInc/nc/bin/nc/checkdirs
```

Note: nccheckdirs, if run by the super-user account, will correct errors found in directory ownership and permission settings. When run by regular accounts, nccheckdirs will perform the checks but not attempt repairs.

4.2 License

The NerveCenter Service requires a license. A license is needed for each host where the NerveCenter Service will run. To obtain a license, whether for product evaluation, for permanent development or for production usage, contact Customer Support at LogMatrix.

The license for each host is supplied as a file. It needs to be placed at /opt/OSInc/conf such that it is named using the output from hostname(1) [/bin/hostname]. The file needs to end with a “.dat” suffix.

For example, if the output from /bin/hostname is “nms01”, then the license for the host needs to be added to /opt/OSInc/conf/ and named “nms01.dat”.

If the output from /bin/hostname contains domain designations, then this needs to be included in the file’s naming.

For example, if the output from /bin/hostname is “nms01.acme-services.co.uk”, then the files needs to be named “nms01.acme-services.co.uk.dat”.

4.3 Service Registration

This section provides instruction on how to change whether NerveCenter should be registered to start at system boot.
To register NerveCenter Service to be started at system boot:

Perform the following:

```
# /opt/OSInc/nc/install/ncservice install
```

This will place the ncservice file to /etc/init.d and run the registration command appropriate for your Linux host.

To unregister NerveCenter Service from being started at system boot:

Perform the following:

```
# /opt/OSInc/nc/install/ncservice uninstall
```

This will unregister the NerveCenter Service using the command appropriate for your Linux host. It will remove the file /etc/init.d/ncservice upon completion.

### 4.4 Linux Link Editor/Loader Cache

The NerveCenter Installer adds sets of shared libraries to a collection of directories under `/opt/OSInc/lib` and `/opt/OSInc/lib64`. Before the NerveCenter Server can be started, these directories need to be added to the Linux host’s link loader database.

#### 4.4.1 Shared Library Registration Setup

Note: The NerveCenter installation script asks whether it should register its shared libraries. If this was agreed to, the following steps have already been performed.

The register NerveCenter’s shared libraries with the host’s link editor/loader, perform the following steps:

```
# cp /opt/OSInc/nc/install/nervecenter.conf /etc/ld.so.conf.d
# /sbin/ldconfig
```

#### 4.4.2 Shared Library Registration Verification

To verify the registration, execute the following command. The output should be a listing of 26 shared libraries.

```
# /sbin/ldconfig -p | grep OSInc
```
Table 5 Verifying Link Loader/Editor Cache Setup

```
#/sbin/ldconfig -p | grep OSInc

libxerces-c.so.25 (libc6) => /opt/OSInc/lib/libxerces-c.so.25
libxerces-c.so (libc6) => /opt/OSInc/lib/libxerces-c.so
libwinsock50.so (libc6) =>
/opt/OSInc/windu/lib.linux_i32/libwinsock50.so
libvdes56.so (libc6) => /opt/OSInc/lib/libvdes56.so
libvdes40.so (libc6) => /opt/OSInc/lib/libvdes40.so
libuser50.so (libc6) => /opt/OSInc/windu.lib.linux_i32/libuser50.so
libstdc++.so.5 (libc6) => /opt/OSInc/lib/libstdc++.so.5
libshell50.so (libc6) => /opt/OSInc/windu/lib.linux_i32/libshell50.so
libriched50.so (libc6) =>
/opt/OSInc/windu/lib.linux_i32/libriched50.so
libpbrnt50.so (libc6) => /opt/OSInc/windu/lib.linux_i32/libpbrnt50.so
libopengl50.so (libc6) =>
/opt/OSInc/windu/lib.linux_i32/libopengl50.so
libolest50.so (libc6) => /opt/OSInc/windu/lib.linux_i32/libolest50.so
libmfc50.so (libc6) => /opt/OSInc/windu/lib.linux_i32/libmfc50.so
libkernel50.so (libc6) =>
/opt/OSInc/windu/lib.linux_i32/libkernel50.so
libgdi50.so (libc6) => /opt/OSInc/windu/lib.linux_i32/libgdi50.so
libddeml50.so (libc6) => /opt/OSInc/windu/lib.linux_i32/libddeml50.so
libcommdlg50.so (libc6) =>
/opt/OSInc/windu/lib.linux_i32/libcommdlg50.so
libcommctrl50.so (libc6) =>
```

4.4.3 Shared Library Binding Verification

The link loader/editor cache can be further checked by running ldd(1) [/usr/bin/ldd] on several of the NerveCenter binaries. The output from ldd will show the resolution which the Linux link editor/loader will perform when these binaries are started. If any of the entries are marked with “not found,” then the link loader cache needs further preparation. Should this occur, contact LogMatrix Support for assistance.

Table 6 Verifying Link Loader Bindings

```
Check 1: Verify ldd resolves run-time library bindings for NerveCenter Server (ncserver)

#/usr/bin/ldd /opt/OSInc/nc/bin/ncserver

linux-gate.so.1 => (0x005d2000)
```
libodbc50.so => /opt/OSInc/windu/lib.linux_i32/libodbc50.so

Check 2: Verify ldd resolves run-time library bindings for NerveCenter SNMP Poller (ncsnmppoller)

# /usr/bin/ldd /opt/OSInc/nc/bin/ncsnmppoller

    linux-gate.so.1  =>  (0x00a52000)
    libpthread.so.0  =>  /lib/libpthread.so.0 (0x00e92000)
    libnsl.so.1  =>  /lib/libnsl.so.1 (0x007a6000)
    librt.so.1  =>  /lib/librt.so.1 (0x007c3000)
    libCstd.so.1  =>  /opt/OSInc/lib/libCstd.so.1 (0x0012c000)

NerveCenter 6.2 Release Notes  Page 17
Check 3: Verify ldd resolves run-time library bindings for NerveCenter Security (ncsecurity)

# /usr/bin/ldd /opt/OSInc/nc/bin/ncsecurity

libCrun.so.1 => /opt/OSInc/bin/libCrunc.so.1 (0x00ae000)
libm.so.6 => /lib/libm.so.6 (0x007ef000)
libc.so.6 => /lib/libc.so.6 (0x002b1000)
/lib/ld-linux.so.2 (0x00634000)

5 Starting and Stopping the NerveCenter Service

5.1 Starting NerveCenter

NerveCenter Service can be started from the command-line or by the system at boot.

If NerveCenter has been registered to start at system boot, the service will be started by
/etc/init.d/ncservice for the registered Linux run levels.

The NerveCenter Service may be started from a command prompt. To do so, execute:

# /opt/OSInc/bin/ncstart

For either a boot-time startup or a command prompt startup, NerveCenter Server will run using
the user account indicated in /opt/OSInc/conf/ncstart-user or else as the super-user account if
this file is not present.

Note: For NerveCenter Service to be started from the command prompt
(/opt/OSInc/bin/ncstart), the command needs to be run from a session using the super-user
account or a user account that is a member of the ‘ncadmins’ group. If the file
/opt/OSInc/conf/ncstart-authorized is present, then the login must match an entry from that file.
5.2 Stopping NerveCenter
The NerveCenter Service can be stopped by the super-user account or by the account named in ncstart-user or else by the user account that ran /opt/OSInc/bin/ncstart.

```bash
# /opt/OSInc/bin/ncstop
```

Attempts to halt the NerveCenter Service via other accounts will fail as they will not have the privileges required to halt the processes.

5.3 Checking Whether NerveCenter Has Been Started
The status of whether the NerveCenter Service is running can be checked.

```bash
# /etc/init.d/ncservice status
```

Or

```bash
# /opt/OSInc/nc/install/ncservice status
```

5.4 Example of Starting and Stopping NerveCenter
The following shows a sequence of checking, starting, checking, stopping and then again checking the NerveCenter Service. These steps can be performed by a login that is a member of ‘ncadmins’.

**Table 7 Example NerveCenter Service Start/Stop Sequence**

<table>
<thead>
<tr>
<th>Step 1. Checking whether the NerveCenter Service is current running</th>
</tr>
</thead>
<tbody>
<tr>
<td>$ /opt/OSInc/nc/install/ncservice status</td>
</tr>
<tr>
<td>ncserver is stopped</td>
</tr>
<tr>
<td>Asks whether NerveCenter Service is current running.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2. Start the NerveCenter Service</th>
</tr>
</thead>
<tbody>
<tr>
<td>$ /opt/OSInc/bin/ncstart</td>
</tr>
<tr>
<td>Start the NerveCenter Service (starts ncserver and its components)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 3: Checking whether the NerveCenter Service is running</th>
</tr>
</thead>
<tbody>
<tr>
<td>$ /opt/OSInc/nc/install/ncservice status</td>
</tr>
<tr>
<td>ncserver (pid 5795) is running…</td>
</tr>
<tr>
<td>The ‘ncstart’ in Step 2 has launched the service.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 4: Stop the NerveCenter Service</th>
</tr>
</thead>
<tbody>
<tr>
<td>$ /opt/OSInc/bin/ncstop</td>
</tr>
<tr>
<td>Stopping NC Server … 5795 waiting 3 seconds for ncserver to terminate.</td>
</tr>
</tbody>
</table>
6 Verifying Login Access

Attempts at logging into the NerveCenter Service pass through the same process as logging in to the host as with scp, ssh or login. NerveCenter registers with the host PAM subsystem and can be administratively configured and monitored just as with scp, ssh or login.

This section explains NerveCenter’s login mechanism and provides the steps needed for adding and maintaining account access to the NerveCenter Service.

6.1 Managing the PAM Integration

The NerveCenter Installer creates the file nervecenter in /etc/pam.d if the file did not previously exist. If /etc/pam.d/nervecenter existed before the execution of the NerveCenter Installer, the file is not overwritten or changed by the installation. (This procedure is a safeguard to prevent upgrades from overwriting changes that may have been made to /etc/pam.d/nervecenter)

A set of default PAM integration files can be found in /opt/OSInc/nc/install. The NerveCenter 6.2 Installer creates /etc/pam.d/nervecenter by copying in pam_nervecenter_rhel6 for RHEL6, CentOS6 hosts or pam_nervecenter_oracle6 for Oracle Linux 6 hosts or by copying in pam_nervecenter_suse11 for SLES11 hosts.

NerveCenter’s PAM integration is explained in ‘Chapter 11: Managing NerveCenter Security’ of the manual Managing NerveCenter. The administrators for the Linux host should review /etc/pam.d/nervecenter and edit its contents to suite the checks and actions appropriate for the host.

Table 8 PAM Documentation References

NerveCenter 6.2 documentation on managing PAM registration.
See Chapter 11: ‘Managing NerveCenter Security’

http://docs.logmatrix.com/NerveCenter/6.2.00/documentation/pdf/managing_nervecenter/manag
6.2 Managing User Access

Only login accounts that are members of the group ‘ncadms’ or else the group ‘ncusers’ may be used to access the NerveCenter Service.

There are four means of accessing a NerveCenter 6.2 Service.

- The NerveCenter Administrator (ncadmin.exe) application can log on to a NerveCenter Service only if the named user is a member of ‘ncadms’.
- The NerveCenter Client (ncclient.exe) application can log on to a NerveCenter Service if the named user is a member of either ‘ncadms’ or ‘ncusers’, but is given full editing abilities only when logged on with an account named in ‘ncadms’.
The NerveCenter Command-line Utility (nccmd.exe) can log onto a NerveCenter Server if the named user is a member of either ‘ncadmins’ or ‘ncusers’, but is give full editing abilities only when logged on with an account named in ‘ncadmins’.

The NerveCenter Perl API can log onto a NerveCenter Server if the named user is a member of either ‘ncadmins’ or ‘ncusers’. Full editing access is granted if the named account is in either group.

Group membership for either ‘ncadmins’ or ‘ncusers’ must be explicitly declared in the host group database (typically /etc/group). To associate an account with either group through the primary group setting of an account, as held in host password database (typically /etc/passwd), is not sufficient on some hosts; be sure the host’s group database names all group members for ‘ncadmins’ and ‘ncusers’. Use the appropriate configuration tool for reviewing and editing the host group database. Ex: YaST on SLES and system-config-users on RHEL6, CentOS6 and Oracle Linux 6.

### 6.3 Testing User Access

Access to the NerveCenter Service can be tested on the Linux host. This is done through an application that mimics the checking done by the NerveCenter Service when it is access by NerveCenter’s Administrator, Client or Command-Line applications. The NerveCenter Service does not need to be running for this test to occur; it operates independently of the service’s status.

To test user access, perform the following as the super-user:

```
# /opt/OSInc/nc/bin/nctestlogin
```

The application will ask for an account name and a password. The password is not shown as it is being entered. Use “-show” on the command-line if you want to visually check that the password is being correctly entered.

#### Table 9 Sample nctestlogin Session

```
# /opt/OSInc/nc/bin/nctestlogin  -show

nctestlogin Version 6.2.00 (6200 BLD12), Linux(el6)/x86-64 (64-bit) Copyright (C) 1989-2015 LogMatrix Inc.

Reading /opt/OSInc/conf/nervecenter.xml
PAM Registration: default, servicename{nervecenter}, authcheck{enabled}, accountcheck{enabled}

Enter user name and password. Or press Enter to quit.
login: nccmd
password: my-secret-nervecenter-password
[2015-09-30 16:59:43] Begin authentication check for nccmd@localhost
1. Check for User account
```
2. Begin PAM access. Using service name "nervecenter"
3. PAM Authentication Check
4. PAM Account Management Check
5. End PAM access
6. Checking Group Membership
   - Searching group 'root'. Members: (no match)
   - Searching group 'ncadmins'. Members: "ncadmin" (match)
   - Success. Granted 'ncadmins'-level access

[2015-09-30 16:59:43] End authentication check for ncadmin@localhost

Enter user name and password. Or press Enter to quit.
login:

The nctestlogin performs the same set of checks, in the same sequence, as done by a running NerveCenter Service. The output shows the progression of six steps. If any step fails, the process stops.

<table>
<thead>
<tr>
<th>Step</th>
<th>Success / Failure Criterion</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Check for User account</td>
<td>Attempts a check, using getpwnam(3), of the known user accounts as defined for the host’s password database (ie: /etc/passwd, NIS, LDAP, etc.). Success: The account exists. Failure: Cannot find the account in the password database. Verify how accounts are set up on the host, being aware of possible Samba, NIS or LDAP integrations (ex: RedHat Directory Server, SUSE LDAP Server, Microsoft Active Directory service, etc.).</td>
</tr>
<tr>
<td>2. Begin PAM access</td>
<td>Opens connection to PAM using pam_start(3). Success: PAM is accessible. Failure: Unable to access PAM. Check that the super-user account is running nctestlogin. Verify presence, proper syntax and content of /etc/pam.d/nervecenter.</td>
</tr>
<tr>
<td>3. PAM Authentication Check</td>
<td>Verifies the provided account name and password using pam_authenticate(3). See the “auth” entries in /etc/pam.d/nervecenter. Success: The provided account and password are a</td>
</tr>
<tr>
<td>Step</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>1.</td>
<td>valid combination. Failure: The combination is not valid. Verify the validity of the password. Verify that account is in good standing (ex: the password may have expired).</td>
</tr>
<tr>
<td>4.</td>
<td>PAM Account Management Check&lt;br&gt; Verifies account standing and performs other checks using pam_acct_mgmt(3).&lt;br&gt; See the “account” entries in /etc/pam.d/nervecenter&lt;br&gt; Success: The named account is in good standing.&lt;br&gt; Failure: Some quality of the account fails a check. (ex: the account is expired or administratively locked out)</td>
</tr>
<tr>
<td>5.</td>
<td>End PAM access&lt;br&gt; Closes connection to PAM. Uses pam_end(3).&lt;br&gt; Always succeeds.</td>
</tr>
<tr>
<td>6.</td>
<td>Checking Group Membership&lt;br&gt; Evaluates whether the named account is named by the groups ‘ncadmins’ or else ‘ncusers’. The check is done through getrnam(3), thereby checking the host’s group database (ie: /etc/group, NIS, LDAP, etc.).&lt;br&gt; Success: The account is named by ‘ncadmins’ or else ‘ncusers’.&lt;br&gt; Failure: Either the groups are missing from /etc/group or membership is missing from the groups.</td>
</tr>
</tbody>
</table>
7  NerveCenter 6.2.00 / Linux Installation Checklist

☐ Prepare Host System
  ☐ Ensure fixed IPv4 addressing
  ☐ Update Host OS patches
  ☐ Create groups ‘ncadmins’ and ‘ncusers’
  ☐ Add required 32-bit software packages
  ☐ Configure firewall
  ☐ Check net-snmp service configuration
  ☐ Check RPC service configuration

☐ Install NerveCenter
  ☐ Select install location (default: /opt/OSInc): ________________________
  ☐ Select ‘a c m s’
  ☐ Choose whether to register NerveCenter for boot-time startup (y/n): ______

☐ Configure NerveCenter
  ☐ Permissions: run /opt/OSInc/nc/bin/ncpermissions
  ☐ Add license file to /opt/OSInc/conf
  ☐ Select NC Service user account(s)
    ☐ Optional: Create or select primary account: _____________
    ☐ Add account(s) to group ‘ncadmins’
    ☐ Optional: Setup file /opt/OSInc/conf/ncstart-authorized
    ☐ Optional: Setup file /opt/OSInc/conf/ncstart-user

☐ Test NerveCenter Configuration
  ☐ Check shared library registrations: Run “/sbin/ldconfig –p”
  ☐ Check boot-time-registration: Check file “/etc/init.d/ncservice”
  ☐ Check PAM integration: Review file “/etc/pam.d/nervecenter”
  ☐ Check account access. Run “/opt/OSInc/nc/bin/nctestlogin”
LogMatrix Technical Support
LogMatrix is committed to offering the industry's best technical support to our customers and partners. You can quickly and easily obtain support for our NerveCenter proactive IT management software.

Professional Services
LogMatrix offers professional services, when customization of our software is the best solution for a customer. These services enable us, in collaboration with our partners, to focus on technology, staffing, and business processes as we address a specific need.

Educational Services
LogMatrix is committed to providing ongoing education and training in the use of our products. Through a combined set of resources, we can offer quality classroom style or tailored on-site training.

Contacting the Customer Support Center
